Technical Support

Symantec Technical Support maintains support centers globally. Technical Support's primary role is to respond to specific queries about product features and functionality. The Technical Support group also creates content for our online Knowledge Base. The Technical Support group works collaboratively with the other functional areas within Symantec to answer your questions in a timely fashion. For example, the Technical Support group works with Product Engineering and Symantec Security Response to provide alerting services and virus definition updates.

Symantec's support offerings include the following:

- A range of support options that give you the flexibility to select the right amount of service for any size organization
- Telephone and/or Web-based support that provides rapid response and up-to-the-minute information
- Upgrade assurance that delivers software upgrades
- Global support purchased on a regional business hours or 24 hours a day, 7 days a week basis
- Premium service offerings that include Account Management Services

For information about Symantec's support offerings, you can visit our website at the following URL:

www.symantec.com/business/support/index.jsp

All support services will be delivered in accordance with your support agreement and the then-current enterprise technical support policy.

Contacting Technical Support

Customers with a current support agreement may access Technical Support information at the following URL:

www.symantec.com/business/support/contact_techsupp_static.jsp

Before contacting Technical Support, make sure you have satisfied the system requirements that are listed in your product documentation. Also, you should be at the computer on which the problem occurred, in case it is necessary to replicate the problem.

When you contact Technical Support, please have the following information available:

- Product release level
- Hardware information

- Available memory, disk space, and NIC information
- Operating system
- Version and patch level
- Network topology
- Router, gateway, and IP address information
- Problem description:
 - Error messages and log files
 - Troubleshooting that was performed before contacting Symantec
 - Recent software configuration changes and network changes

Licensing and registration

If your Symantec product requires registration or a license key, access our technical support Web page at the following URL:

www.symantec.com/business/support/

Customer service

Customer service information is available at the following URL:

www.symantec.com/business/support/

Customer Service is available to assist with non-technical questions, such as the following types of issues:

- Questions regarding product licensing or serialization
- Product registration updates, such as address or name changes
- General product information (features, language availability, local dealers)
- Latest information about product updates and upgrades
- Information about upgrade assurance and support contracts
- Information about the Symantec Buying Programs
- Advice about Symantec's technical support options
- Nontechnical presales questions
- Issues that are related to CD-ROMs or manuals

Support agreement resources

If you want to contact us regarding an existing support agreement, please contact the support agreement administration team for your region as follows:

Asia-Pacific and Japan	customercare_apj@symantec.com
Europe, Middle-East, and Africa	semea@symantec.com
North America and Latin America	supportsolutions@symantec.com

Documentation

Product guides are available on the media in PDF format. Make sure that you are using the current version of the documentation. The document version appears on page 2 of each guide. The latest product documentation is available on the Symantec website.

<https://sort.symantec.com/documents>

Your feedback on product documentation is important to us. Send suggestions for improvements and reports on errors or omissions. Include the title and document version (located on the second page), and chapter and section titles of the text on which you are reporting. Send feedback to:

doc_feedback@symantec.com

For information regarding the latest HOWTO articles, documentation updates, or to ask a question regarding product documentation, visit the Storage and Clustering Documentation forum on Symantec Connect.

<https://www-secure.symantec.com/connect/storage-management/forums/storage-and-clustering-documentation>

About Symantec Connect

Symantec Connect is the peer-to-peer technical community site for Symantec's enterprise customers. Participants can connect and share information with other product users, including creating forum posts, articles, videos, downloads, blogs and suggesting ideas, as well as interact with Symantec product teams and Technical Support. Content is rated by the community, and members receive reward points for their contributions.

Introducing the agent for Content Server

This chapter includes the following topics:

- [About the Cluster Server agent for Content Server](#)
- [Supported software](#)
- [How the agent makes Content Server highly available](#)
- [Content Server agent functions](#)

About the Cluster Server agent for Content Server

Cluster Server (VCS) agents monitor specific resources within an enterprise application. They determine the status of resources and start or stop them according to external events.

The Cluster Server agent for Content Server provides high availability for a Content Server in a clustered environment. The agent brings specific instances of the Content Server online, monitors the instance, and brings it offline. The agent monitors the processes of the Content Server instance and shuts down the Content Server in case of a failure.

See the Agent Pack Release Notes for the latest updates or software issues for this agent.

Supported software

For information on the software versions that the Cluster Server agent for Content Server supports, see the Symantec Operations Readiness Tools (SORT) site: <https://sort.symantec.com/agents>.

How the agent makes Content Server highly available

The Cluster Server agent for Content Server continuously monitors the Content Server processes to verify that they function properly.

The agent provides the following levels of application monitoring:

- **Primary or Basic monitoring**
This mode has Process check and Health check monitoring options. With the default Process check option, the agent verifies that the Content Server processes are present in the process table. Process check cannot detect whether processes are in the hung or stopped states.
- **Secondary or Detail monitoring**
In this mode, the agent runs a utility to verify the status of the Content Server. The agent detects application failure if the monitoring routine reports an improper function of the Content Server processes. When this application failure occurs, the Content Server service group fails over to another node in the cluster. Thus, the agent ensures high availability for Content Servers.

Content Server agent functions

The agent consists of resource type declarations and agent executables. The agent executables implement online, offline, monitor, and clean operations.

Online

The online operation performs the following tasks:

- Performs the preliminary check to ensure that the Content Server instance is not online on the specified node in the cluster.
- Uses the Content Server start script `dm_start_DocbaseName` to start the Content Server instance using the name of the repository, the content server manages. The online function sources a shell script or a program that the `EnvFile` attribute specifies. The script or program ensures that the required shell environment variables are properly set before it executes the start script.
- Ensures that the Content Server instance is up and running successfully. The operation uses the wait period that the `OnlineTimeout` attribute specifies, to enable the Content Server instance to initialize completely before it allows the monitor function to probe the resource.

Offline

The offline operation performs the following tasks:

- Verifies that the Content Server instance is not already offline.
- Uses the Content Server stop script `dm_shutdown_DocbaseName` to stop the Content Server instance using the name of the repository the Content Server manages. The offline function also sources a shell script or a program that the `EnvFile` attribute specifies. The script or program ensures that the required shell environment variables are properly set before it executes the stop script.
- Ensures that the Content Server instance is given enough time to go offline successfully. The operation uses a wait period that the `OfflineTimeout` attribute specifies, to allow the Content Server instance to complete the offline sequence before it allows further probing of the resource.

Monitor

The monitor function monitors the state of the Content Server instance running on all nodes within the cluster.

The monitor operation performs following tasks:

- The first level check scans the system process table and searches the processes that must be running for Content Server instance. If the first level check does not find these processes running on the node, the check exits immediately, and reports the Content Server instance as offline.
- If the `SecondLevelMonitor` attribute is set to greater than 0, the monitor function performs a second-level check to determine the status of the Content Server instance. The Content Server installation provides the java program. The second-level check runs the java program provided by Content Server installation to ensure that the processes are truly available for Content Server instance.
- Depending upon the `MonitorProgram` attribute, the monitor function can perform a customized check using a user-supplied monitoring utility.
See [“Executing a customized monitoring program”](#) on page 31.

Clean

In case of a failure or after an unsuccessful attempt to be online or offline, the clean function removes any Content Server processes remaining in the system.

The clean operation performs following tasks:

- Attempts to gracefully shut down the Content Server instance.

- If a graceful shutdown fails, the clean function looks for all the processes running for the Content Server instance, and cleans the processes by killing them.

Installing and configuring Content Server for high availability

This chapter includes the following topics:

- [About Content Server](#)
- [Uniquely identifying Content Server instances](#)
- [About configuring Content Server for high availability](#)
- [Configuring the Content Server for high availability](#)

About Content Server

Content Servers are the processes that provide client access to the repository. They receive queries from clients in the form of DFC methods or DQL statements and make a call to the underlying RDBMS or the file directories. Every repository must have at least one active server. If a repository does not have an active server, then users cannot access that repository.

When a server is started, the resulting server process is called a parent server. Each time a client asks for a repository connection through a parent server, the parent server spawns another server process to service that client. These spawned server processes are called session servers. They are active until the session is active. When the session terminates, the session servers also terminate. The number of session servers that can be spawned from a parent server are configurable.

The Content Server depends on the Connection Broker for its functioning. The connection broker is intermediary between the client and the server when a client wants a repository connection. If a server is not known to even one connection broker, the clients cannot connect to the repository associated with the server. Each server regularly projects connection information to at least one connection broker. When a client wants to connect to a content server repository, it contacts the connection broker and requests for the connection information for the Content Server repository. The connection broker sends back the IP address for the host where the Content Server resides and the port number that the Content Server uses. The client application uses the information to open a connection to Content Server.

Figure 2-1 A simple deployment topology

In simple configuration, connection broker can be installed and started on the Content Server host or the Content Server can project one or more connection brokers that are located on a different host.

Uniquely identifying Content Server instances

For multiple Content Server instances running concurrently on a single node, the Cluster Server agent must be able to uniquely identify each of the Content Server instance on that system. Each Content Server instance has a unique configuration or an initialization file. The agent uses the `InitFile` attribute value to identify the Content Server instance uniquely.

Differentiating the Content Server instances is important to identify each Content Server uniquely. When the Cluster Server agent kills the processes of a non-responsive or failed Content Server instance, in the absence of an unique `InitFile` for each Content Server instance, the agent may kill processes for more than one Content Server instance during a clean operation.

About configuring Content Server for high availability

To configure the Content Server instance for high availability ensure that you install it on all the nodes in the cluster and associate it to a virtual host/IP.

In addition, store the repository (managed by content server) data on a shared storage.

During the service group configuration ensure that you create a service group dependency between the Content Server and Connection Broker agent service groups. The dependency type between the Connection Broker service group and service group containing the resource for Content Server must be 'Online Global Soft'.

In a typical configuration when the Connection Broker goes offline the Content Server cannot establish any new client connection. However, the existing client connections remain unaffected. Thus, the service group containing the Content Server should not fault or fail over in case the Connection Broker service group faults. The Connection Broker can be running on any node and the Content Server configuration would be aware of the Connection Broker hostname and the port to which it has to broadcast the information. Once the Connection Broker is online again, the Content Server broadcasts the information to the Connection Broker and the session is resumed. This eliminates the need to restart the Content Server.

Hence the dependency type between two service group is 'Online Global Soft' with the Content Server group as the parent and the Connection Broker group as the child.

Configuring the Content Server for high availability

This section provides the information about the tasks you must perform to configure Content Server for high availability.

Synchronizing accounts and services

Ensure that you synchronize accounts and services in the following ways:

- Synchronize the Documentum user accounts user name, UNIX uid, group name, and UNIX gid across all nodes in the cluster.
- The `/etc/services` entries should be consistent on all cluster nodes.

Removing physical host dependencies

Perform the following tasks to remove the physical host dependencies:

- Add `host` parameter to `server.ini` file under `[SERVER_STARTUP]` section if it does not exist (`$DOCUMENTUM/dba/confing/$DocbaseName/server.ini`).
`host = content server virtual hostname`
- Modify `[DOCBROKER_PROJECTION_TARGET]` and `[DOCBROKER_PROJECTION_TARGET_n]` sections in the `server.ini` file to have correct connection broker information.
`host = connection broker virtual hostname`
`port = connection broker port number`

Installing, upgrading, and removing the agent for Content Server

This chapter includes the following topics:

- [Before you install the Cluster Server agent for Content Server](#)
- [About the ACC library](#)
- [Installing the ACC library](#)
- [Installing the agent in a VCS environment](#)
- [Uninstalling the agent in a VCS environment](#)
- [Removing the ACC library](#)

Before you install the Cluster Server agent for Content Server

You must install the Cluster Server agent for Content Server on all the systems that will host Content Server service groups.

Before you install the agent for Content Server, ensure that the following prerequisites are met.

- Install and configure Cluster Server.
For more information on installing and configuring Cluster Server, refer to the Cluster Server installation and configuration guides.
- Install the latest version of ACC Library.

To install or update the ACC Library package, locate the library and related documentation in the Agent Pack tarball,
See “[Installing the ACC library](#)” on page 17.

About the ACC library

The operations of a Cluster Server agent depend on a set of Perl modules known as the ACC library. The library must be installed on each system in the cluster that runs the agent. The ACC library contains common, reusable functions that perform tasks, such as process identification, logging, and system calls.

Instructions to install or remove the ACC library on a single system in the cluster are given in the following sections. The instructions assume that the ACCLib tar file has already been extracted.

Note: The LogDbg attribute should be used to enable debug logs for the ACCLib-based agents when the ACCLib version is 6.2.0.0 or later and VCS version is 6.2 or later.

Installing the ACC library

Install the ACC library on each system in the cluster that runs an agent that depends on the ACC library.

To install the ACC library

- 1 Log in as a superuser.
- 2 Download ACC Library.

You can download either the complete Agent Pack tar file or the individual ACCLib tar file from the Symantec Operations Readiness Tools (SORT) site (<https://sort.symantec.com/agents>).

- 3 If you downloaded the complete Agent Pack tar file, navigate to the directory containing the package for the platform running in your environment.

AIX	<code>cd1/aix/vcs/application/acc_library/version_library/pkgs</code>
HP-UX	<code>cd1/hpux/generic/vcs/application/acc_library/version_library/pkgs</code>
Linux	<code>cd1/linux/generic/vcs/application/acc_library/version_library/rpms</code>
Solaris	<code>cd1/solaris/dist_arch/vcs/application/acc_library/version_library/pkgs</code>

where *dist_arch* is `sol_sparc`

- 4 If you downloaded the individual ACCLib tar file, navigate to the pkgs directory (for AIX and Solaris), or rpms directory (for Linux).
- 5 Install the package. Enter **Yes**, if asked to confirm overwriting of files in the existing package.

```
AIX          # installp -ac -d VRTSacclib.bff VRTSacclib
HP-UX        # swinstall -s `pwd` VRTSacclib
Linux        # rpm -i \
              VRTSacclib-VersionNumber-GA_GENERIC.noarch.rpm
Solaris      # pkgadd -d VRTSacclib.pkg
```

Note: The LogDbg attribute should be used to enable debug logs for the ACCLib-based agents when the ACCLib version is 6.2.0.0 or later and VCS version is 6.2 or later.

Installing the ACC library IPS package on Oracle Solaris 11 systems

To install the ACC library IPS package on an Oracle Solaris 11 system

- 1 Copy the VRTSacclib.p5p package from the pkgs directory to the system in the /tmp/install directory.
- 2 Disable the publishers that are not reachable as package install may fail, if any, of the already added repositories are unreachable.

```
# pkg set-publisher --disable <publisher name>
```

- 3 Add a file-based repository in the system.

```
# pkg set-publisher -g /tmp/install/VRTSacclib.p5p Symantec
```

- 4 Install the package.

```
# pkg install --accept VRTSacclib
```

- 5 Remove the publisher from the system.

```
# pkg unset-publisher Symantec
```

- 6 Enable the publishers that were disabled earlier.

```
# pkg set-publisher --enable <publisher name>
```

Installing the ACC library package on Solaris brand non-global zones

With Oracle Solaris 11, you must install the ACC library package inside non-global zones. The native non-global zones are called Solaris brand zones.

To install the ACC library package on Solaris brand non-global zones

- 1 Ensure that the SMF service
`svc:/application/pkg/system-repository:default` and
`svc:/application/pkg/zones-proxyd:default` are online on the global zone.

```
# svcctl svc:/application/pkg/system-repository:default
# svcctl svc:/application/pkg/zones-proxyd:default
```
- 2 Log on to the non-global zone as a superuser.
- 3 Ensure that the SMF service
`svc:/application/pkg/zones-proxy-client:default` is online inside the non-global zone:

```
# svcctl svc:/application/pkg/zones-proxy-client:default
```
- 4 Copy the `VRTSacclib.p5p` package from the `pkgs` directory to the non-global zone (for example, at the `/tmp/install` directory).
- 5 Disable the publishers that are not reachable, as package install may fail if any of the already added repositories are unreachable.

```
# pkg set-publisher --disable <publisher name>
```
- 6 Add a file-based repository in the non-global zone.

```
# pkg set-publisher -g/tmp/install/VRTSacclib.p5p Symantec
```
- 7 Install the package.

```
# pkg install --accept VRTSacclib
```
- 8 Remove the publisher on the non-global zone.

```
# pkg unset-publisher Symantec
```
- 9 Clear the state of the SMF service, as setting the file-based repository causes the SMF service `svc:/application/pkg/system-repository:default` to go into the maintenance state.

```
# svcadm clear svc:/application/pkg/system-repository:default
```
- 10 Enable the publishers that were disabled earlier.

```
# pkg set-publisher --enable <publisher>
```

Note: Perform steps 2 through 10 on each non-global zone.

Installing the agent in a VCS environment

Install the agent for Content Server on each node in the cluster.

Note: The agent package VRTSvcsdctm includes the Cluster Server agents for Content Server and Connection Broker. So, the following procedure to install the agent for ContentServer also installs the agent for ConnectionBroker.

To install the agent in a VCS environment

- 1 Download the agent from the Symantec Operations Readiness Tools (SORT) site: <https://sort.symantec.com/agents>.

You can download either the complete Agent Pack tar file or an individual agent tar file.

- 2 Uncompress the file to a temporary location, say /tmp.
- 3 If you downloaded the complete Agent Pack tar file, navigate to the directory containing the package for the platform running in your environment.

```
AIX      cd1/aix/vcs/application/documentum_agent/  
          vcs_version/version_agent/pkggs
```

```
HP-UX    cd1/hpux/generic/vcs/application/documentum_agent/  
          vcs_version/version_agent/pkggs
```

```
Linux    cd1/linux/generic/vcs/application/documentum_agent/  
          vcs_version/version_agent/rpms
```

```
Solaris  cd1/solaris/dist_arch/vcs/application/documentum_agent/  
          vcs_version/version_agent/pkggs  
          where, dist_arch is sol_sparc.
```

If you downloaded the individual agent tar file, navigate to the pkggs directory (for AIX and Solaris), or rpms directory (for Linux).

- 4 Log in as a superuser.

5 Install the package.

```
AIX          # installp -ac -d  
              VRTSvcsdctm.rte.bff VRTSvcsdctm.rte  
  
HP-UX        # swinstall -s `pwd` VRTSvcsdctm  
  
Linux        # rpm -ihv \  
              VRTSvcsdctm-AgentVersion-GA_GENERIC.noarch.rpm  
  
Solaris      # pkgadd -d . VRTSvcsdctm
```

6 After installing the agent package, you must import the agent type configuration file.

Installing the agent IPS package on Oracle Solaris 11 systems

To install the agent IPS package on an Oracle Solaris 11 system**1** Copy the VRTSvcsdctm.p5p package from the pkgs directory to the system in the /tmp/install directory.**2** Disable the publishers that are not reachable as package install may fail if any of the already added repositories are unreachable.

```
# pkg set-publisher --disable <publisher name>
```

where the publisher name is obtained using the `pkg publisher` command.

3 Add a file-based repository in the system.

```
# pkg set-publisher -g /tmp/install/VRTSvcsdctm.p5p Symantec
```

4 Install the package.

```
# pkg install --accept VRTSvcsdctm
```

5 Remove the publisher from the system.

```
# pkg unset-publisher Symantec
```

6 Enable the publishers that were disabled earlier.

```
# pkg set-publisher --enable <publisher name>
```

Installing agent packages on Solaris brand non-global zones

With Oracle Solaris 11, you must install the agent package inside non-global zones. The native non-global zones are called Solaris brand zones.

To install the agent package on Solaris brand non-global zones

- 1 Ensure that the SMF service
`svc:/application/pkg/system-repository:default` and
`svc:/application/pkg/zones-proxyd:default` are online on the global zone.

```
# svcctl svc:/application/pkg/system-repository:default
# svcctl svc:/application/pkg/zones-proxyd:default
```
- 2 Log on to the non-global zone as a superuser.
- 3 Ensure that the SMF service
`svc:/application/pkg/zones-proxy-client:default` is online inside non-global zone:

```
# svcctl svc:/application/pkg/zones-proxy-client:default
```
- 4 Copy the `VRTSvcscdctm.p5p` package from the `pkgs` directory to the non-global zone (for example, at the `/tmp/install` directory).
- 5 Disable the publishers that are not reachable, as package install may fail if any of the already added repositories are unreachable.

```
# pkg set-publisher --disable <publisher name>
```
- 6 Add a file-based repository in the non-global zone.

```
# pkg set-publisher -g/tmp/install/VRTSvcscdctm.p5p Symantec
```
- 7 Install the package.

```
# pkg install --accept VRTSvcscdctm
```
- 8 Remove the publisher on the non-global zone.

```
# pkg unset-publisher Symantec
```
- 9 Clear the state of the SMF service, as setting the file-based repository causes the SMF service `svc:/application/pkg/system-repository:default` to go into the maintenance state.

```
# svcadm clear svc:/application/pkg/system-repository:default
```
- 10 Enable the publishers that were disabled earlier.

```
# pkg set-publisher --enable <publisher>
```

Note: Perform steps 2 through 10 on each non-global zone.

Uninstalling the agent in a VCS environment

You must uninstall the agent for Content Server from a cluster while the cluster is active.

Warning: The agent package VRTSvcsdctm includes the agents for Content Server and Connection Broker. So, the following procedure to remove the agent for ContentServer also removes the agent for ConnectionBroker.

To uninstall the agent in a VCS environment

- 1 Log in as a superuser.
- 2 Set the cluster configuration mode to read/write by running the following command from any node in the cluster:

```
# haconf -makerw
```

- 3 Remove all Content Server resources from the cluster. Run the following command to verify that all resources have been removed:

```
# hares -list Type=ContentServer
```

- 4 Remove the agent type from the cluster configuration by running the following command from any node in the cluster:

```
# hatype -delete ContentServer
```

Removing the agent's type file from the cluster removes the include statement for the agent from the `main.cf` file, but the agent's type file is not removed from the cluster configuration directory. You can remove the agent's type file later from the cluster configuration directory.

- 5 Save these changes. Then set the cluster configuration mode to read-only by running the following command from any node in the cluster:

```
# haconf -dump -makero
```

- 6 Use the platform's native software management program to remove the agent for Content Server from each node in the cluster.

Run the following command to uninstall the agent:

AIX `# installp -u VRTSvcscdctm.rte`

HP-UX `# swremove VRTSvcscdctm`

Linux `# rpm -e VRTSvcscdctm`

Solaris `# pkgrm VRTSvcscdctm`

Note: To uninstall the agent IPS package on a Solaris 11 system, run the following command:

```
# pkg uninstall VRTSvcscdctm
```

Removing the ACC library

Perform the following steps to remove the ACC library.

To remove the ACC library

- 1 Ensure that all agents that use ACC library are removed.
- 2 Run the following command to remove the ACC library package.

AIX `# installp -u VRTSacclib`

HP-UX `# swremove VRTSacclib`

Linux `# rpm -e VRTSacclib`

Solaris `# pkgrm VRTSacclib`

Note: To uninstall the ACCLib IPS package on a Solaris 11 system, run the following command:

```
# pkg uninstall VRTSacclib
```

Configuring the agent for Content Server

This chapter includes the following topics:

- [About configuring the Cluster Server agent for Content Server](#)
- [Importing the agent types files in a VCS environment](#)
- [Documentum Content Server agent attributes](#)
- [Executing a customized monitoring program](#)

About configuring the Cluster Server agent for Content Server

After installing the Cluster Server agent for Content Server, you must import the agent type configuration file. After importing this file, review the attributes table that describes the resource type and its attributes, and then create and configure Content Server resources.

To view the sample agent type definition and service groups configuration:

See [“About sample configurations for the agents for Content Server”](#) on page 42.

Importing the agent types files in a VCS environment

To use the agent for Content Server, you must import the agent types file into the cluster.

You can import the agent types file using the VCS graphical user interface or using the command line interface.

To import the agent types file using the VCS graphical user interface

- 1** Start the Cluster Manager (Java Console) and connect to the cluster on which the agent is installed.
- 2** Click **File > Import Types**.
- 3** In the **Import Types** dialog box, select the following file:

VCS 4.x	■ AIX	/etc/VRTSvcs/conf/sample_ContentServer/
	■ HP-UX	DocumentumTypes.cf
	■ Linux	
	■ Solaris	
VCS 5.x or later	■ AIX	/etc/VRTSagents/ha/conf/ContentServer/
	■ HP-UX	DocumentumTypes.cf
	■ Linux	
VCS 5.0	Solaris	/etc/VRTSagents/ha/conf/ContentServer/ DocumentumTypes50.cf
VCS 5.1 or later	Solaris	/etc/VRTSagents/ha/conf/ContentServer/ DocumentumTypes51.cf

- 4** Click **Import**.
- 5** Save the VCS configuration.

The ContentServer agent type is now imported to the VCS engine.

Note: The Documentum.cf file contains the agent type definition for ContentServer and ConnectionBroker. Hence, the above procedure will import the agent type definition for both ContentServer and ConnectionBroker agent.

You can now create Content Server resources. For additional information about using the VCS GUI, refer to the *Cluster Server Administrator's Guide*.

To import the agent types file using the command line interface (CLI):

- 1** If VCS is running, run the
`/etc/VRTSagents/ha/conf/ContentServer/DocumentumTypes.cmd` file from the command line.
- 2** If VCS is not running, perform the following steps:
 1. Copy the agent types file from the
`/etc/VRTSagents/ha/conf/ContentServer/<AgentTypes_file>` directory to the `/etc/VRTSvcs/conf/config` directory.

Where, <AgentTypes_file> is chosen according to the following table:

VCS 4.x	■ AIX	<code>/etc/VRTSvcs/conf/sample_ContentServer/</code>
	■ HP-UX	<code>DocumentumTypes.cf</code>
	■ Linux	
	■ Solaris	
VCS 5.x or later	■ AIX	<code>/etc/VRTSagents/ha/conf/ContentServer/</code>
	■ HP-UX	<code>DocumentumTypes.cf</code>
	■ Linux	
VCS 5.0	Solaris SPARC	<code>/etc/VRTSagents/ha/conf/ContentServer/</code>
		<code>DocumentumTypes50.cf</code>
VCS 5.1 or later	Solaris SPARC	<code>/etc/VRTSagents/ha/conf/ContentServer/</code>
		<code>DocumentumTypes51.cf</code>

2. Include the agent types file in the `main.cf` file.
3. Start HAD.

Documentum Content Server agent attributes

Refer to the required attributes and optional attributes while configuring the agent for ContentServer.

[Table 4-1](#) lists the required attributes for the ContentServer agent.

Table 4-1 Required attributes

Required attributes	Description
DocbaseName	<p>Specifies the name of the docbase repository which the content server manages.</p> <p>Type and Dimension: string-scaler</p> <p>Default: ""</p> <p>Example: REPCVR</p>
DMBase	<p>Specifies the absolute path of the directory where the content server scripts <code>dm_start_DocbaseName</code> reside.</p> <p>Type and Dimension: string-scaler</p> <p>Default: ""</p> <p>Example: /documentum/dba</p>
InitFile	<p>Specifies the configuration or Initialization file for the Content Server instance. The agent uses this attribute value to uniquely identify the running Content Server instance.</p> <p>Type and Dimension: string-scaler</p> <p>Default: ""</p> <p>Example: /documentum/dba/config/REPCVR/server.ini</p>
DMUser	<p>Specifies the user name that the Agent uses to execute the programs for managing a content server.</p> <p>The user name must be synchronized across the systems in the cluster. The user name must resolve to the same UID and have the same default shell on each system in the cluster. The Agent entry points use the <code>getpwnam (3c)</code> function call to obtain UNIX user attributes. Hence, the user can be defined locally or can be defined in a common repository (NIS, NIS+, or LDAP). If the user is defined to a repository, the agent will fail if the access to the repository fails.</p> <p>The supported shell environments are: ksh, sh, and csh.</p> <p>Type and Dimension: string-scaler</p> <p>Default: ""</p> <p>Example: cvradm</p>

Table 4-1 Required attributes (*continued*)

Required attributes	Description
EnvFile	<p>Specifies the absolute path to the file that must be sourced with the UNIX shell. Source this file to set the environment before executing Content Server scripts for online, offline, monitor, and clean operations.</p> <p>The shell environments supported are: ksh, sh, and csh.</p> <p>Note: Ensure that the syntax of this file is in accordance with the user shell that the DMUser attribute specifies. Review the information about how to generate environments file for Documentum ContentServer.</p> <p>See “Generating the environments file for Content Server” on page 36.</p> <p>Type and Dimension: string-scaler</p> <p>Default: "/dev/null"</p> <p>Example: /documentum /envfile</p>
ResLogLevel	<p>Specifies the logging detail performed by the agent for the resource.</p> <p>The valid values are as follows:</p> <ul style="list-style-type: none"> ■ ERROR: Only logs error messages. ■ WARN: Logs above plus warning messages. ■ INFO: Logs above plus warning messages. ■ TRACE: Logs above plus trace messages. TRACE is very verbose and should only be used during initial configuration or for troubleshooting and diagnostic operations. <p>Type and Dimension: string-scaler</p> <p>Default: INFO</p> <p>Example: TRACE</p>

[Table 4-2](#) lists the optional attributes for the ContentServer agent.

Table 4-2 Optional attributes

Optional attribute	Description
SecondLevelMonitor	<p>Used to enable second-level monitoring. Second-level monitoring is a deeper, more thorough state check of the Content Server. The numeric value specifies how often the monitoring routines must run. 0 means never run the second-level monitoring routines, 1 means run routines every monitor interval, 2 means run routines every second monitor interval. This interpretation may be extended to other values.</p> <p>Note: Exercise caution while setting SecondLevelMonitor to large numbers. For example, if the MonitorInterval is set to 60 seconds and the SecondLevelMonitor is set to 100, then the second level check is executed every 100 minutes, which may not be as often as intended. For maximum flexibility, no upper limit is defined for SecondLevelMonitor.</p> <p>Also, verify the second level monitoring utility before enabling second level monitor.</p> <p>See "Verifying Second Level Monitor command" on page 39.</p> <p>Type and Dimension: integer-scaler</p> <p>Default: 0</p> <p>Example: 5</p>
MonitorProgram	<p>Specifies the absolute path of an external, the user supplied monitor executable.</p> <p>See "Executing a customized monitoring program" on page 31.</p> <p>Type and Dimension: string-scaler</p> <p>Default: ""</p> <p>Example: /documenytum/myMonitor.sh</p>
JavaHome	<p>Specifies the absolute path of the Documentum java bin directory. The value of this attribute is used to run the SecondLevelMonitor java program.</p> <p>Type and Dimension: string-scaler</p> <p>Default: ""</p> <p>Example: /documentum/shared/java/1.5.0_12</p>

Executing a customized monitoring program

The monitor function executes a custom monitor program to perform an additional Content Server state check. The monitor function executes the utility specified in the MonitorProgram attribute, if:

- The specified utility is a valid executable file.
- The first-level process check indicates that the Content Server instance is online.
- The SecondLevelMonitor attribute is either set to 0 or 1, and the second-level check indicates that the Content Server instance is online.
- The SecondLevelMonitor attribute is set to greater than 1, but the second-level check is deferred for this monitoring cycle.

The monitor function interprets the utility exit code as follows:

110 or 0	ContentServer server instance is online
100 or 1	ContentServer server instance is offline
99	ContentServer server instance is unknown
Any other value	ContentServer server instance is unknown

110 or 0	ContentServer instance is online
110 or 1	ContentServer instance is offline
99	ContentServer instance is unknown
Any other value	ContentServer instance is unknown

To ensure that the customized utility is always available to the agent, Symantec recommends storing the file in a shared directory that is available on an online node.

Configuring the service groups for Content Server using the CLI

This chapter includes the following topics:

- [About configuring service groups for Content Server](#)
- [Before configuring the service groups for Content Server](#)
- [Configuring service groups for Content Server](#)
- [Generating the environments file for Content Server](#)

About configuring service groups for Content Server

Configuring the Content Server service group involves creating the ContentServer service group, its resources, and defining attribute values for the configured resources. You must have administrator privileges to create and configure a service group.

You can configure the service groups using one of the following:

- The Cluster Manager (Java console)
- Veritas Infoscale Operations Manager
- The command line

See [“Configuring service groups for Content Server”](#) on page 33.

Before configuring the service groups for Content Server

Before you configure the Content Server service group, you must:

- Verify that Cluster Server is installed and configured on all nodes in the cluster where you will configure the service group.
For more information on installing and configuring Cluster Server, refer to the Cluster Server installation and configuration guides.
- Verify that Content Server is installed and configured identically on all nodes in the cluster.
See [“About configuring Content Server for high availability”](#) on page 14.
- Verify that the Cluster Server agent for Content Server is installed on all nodes in the cluster.
See [“Installing the agent in a VCS environment”](#) on page 20.
- Verify that the type definition for the Cluster Server agent for Content Server is imported into the VCS engine.
See [“Importing the agent types files in a VCS environment”](#) on page 25.

Configuring service groups for Content Server

While setting up a cluster, you must ensure that the cluster has some spare capacity to handle the Content Server failover scenarios.

The cluster should be able to provide application failover by encapsulating the resources required for an application into a service group. A service group is a virtualized application that can switch between the cluster nodes. It contains a set of dependent resources, such as disk groups, disk volumes, file systems, IP addresses, NIC cards, and dependent application processes. It also includes logic about the dependencies between the application components.

These service groups should thus be configured such that the cluster can start, stop, monitor, and switch the service groups between the nodes, depending upon the server faults or resource faults. An administrator should also be proactively able to move a service group between cluster nodes to perform preventative maintenance or apply patches.

Perform the following steps to add a service group for Content Server

- 1** Create a service group for Content Server.

```
# hagrps -add DCM652-CS
```

For more details on creating a service group refer to, *Cluster Server Administrator's Guide*.

- 2** Modify the SystemList attribute for the group, to add systems.

For example,

```
# hagrps -modify DCM652-CS SystemList systemA 0 systemB 1
```

- 3** Create resources for NIC and IP in the service group.

For example,

```
# hares -add DCM652-CS_nic NIC DCM652-CS
```

```
# hares -DCM652-CS_ip IP DCM652-CS
```

For more details on creating and modifying resource attributes for NIC, IP, DiskGroup, Volume, and Mount refer to, *Cluster Server Bundled Agents Reference Guide*.

- 4** Create links between the resources.

For example,

```
# hares -link DCM652-CS_ip DCM652-CS_nic
```

- 5** If you have not installed the data directory of the repository on shared file system then follow the steps 6 onwards, otherwise, directly go to step 9 and continue further.
- 6** Create a separate file system for Content Server on shared disk.
- 7** Copy the contents of the data directory of the Content Server to this shared file system.
- 8** Delete the contents of the data directory and then create a link between the data directory and the directory on the shared disk, on which you copied the contents of that data directory.

- 9 Add the file system to respective agent service group using the Mount, DiskGroup, and Volume resources.

Create Mount and DiskGroup resources.

For example,

```
# hares -add DCM652-CS_dg DiskGroup DCM652-CS
# hares -DCM652-CS_mnt Mount DCM652-CS
```

Based on the Content Server instance you cluster, modify the resource attributes of the Mount and DiskGroup resources.

- 10 Create links between the Mount and DiskGroup resources.

For example,

```
# hares -link DCM652-CS_mnt DCM652-CS_dg
```

- 11 Create the resource for the Content Server.

For example,

```
# hares -add DCM652-CS_cs ContentServer DCM652-CS
```

Based on the Content Server instance you cluster, modify the resource attributes.

See [“Documentum Content Server agent attributes”](#) on page 27.

- 12 Create resource dependencies for ContentServer resource.

The ContentServer resource depends on the IP and Mount resources.

```
# hares -link DCM652-CS_cs DCM652-CS_ip
# hares -link DCM652-CS_cs DCM652-CS_mnt
```

- 13 Verify the final resource dependencies for DCM652-CS server group.

For example,

```
# hares -dep
```

Group	Parent	Child
DCM652-CS	DCM652-CS_cs	DCM652-CS_ip
DCM652-CS	DCM652-CS_cs	DCM652-CS_mnt
DCM652-CS	DCM652-CS_ip	DCM652-CS_nic
DCM652-CS	DCM652-CS_mnt	DCM652-CS_dg

Generating the environments file for Content Server

Note: The application itself provides the environment file with the recent versions of Documentum. For example, with Documentum version 7.1, the following files are available:

```
$DOCUMENTUM/product/version_number/bin/dm_set_server_env.sh or
```

```
$DOCUMENTUM/product/version_number/bin/dm_set_server_env.csh
```

You can edit the environment file and use it to ensure that VCS agent for Content Server works correctly. You should also ensure that the ORACLE_HOME variable is set correctly in the environment file.

To generate the environments file for Content Server

- 1 Login as Documentum user using the following command.

```
su - dmadmin
```

- 2 Capture the environment with the following command.

```
env > /home/dmadmin/dmadmin.env
```

- 3 Modify the file according to the Documentum user shell environment.

For example, if the generated file contains environments for bash shell and Documentum user shell is C shell, convert the file to C shell environments.

- Edit the dmadmin.env file to add string 'setenv' at the beginning of each line.
- Replace the '=' with space " " in the file.

- 4 Copy the dmadmin.env file to shared directory and use it as the Content Server instance environments file in EnvFile attribute. Ensure that the permissions are set properly for user Documentum user.

```
chmod 755 dmadmin.env
```

Note: Before generating the EnvFile, verify the successful execution of start, stop, and second level monitor command with Documentum user environment.

Troubleshooting the agent for Content Server

This chapter includes the following topics:

- [Using the correct software and operating system versions](#)
- [Meeting prerequisites](#)
- [Configuring Content Server resources](#)
- [Starting the Content Server instance outside a cluster](#)
- [Verifying Second Level Monitor command](#)
- [Reviewing error log files](#)

Using the correct software and operating system versions

Ensure that you use correct software and operating system versions.

For information on the software versions that the agent for Content Server supports, see the Symantec Operations Readiness Tools (SORT) site:

<https://sort.symantec.com/agents>.

Meeting prerequisites

Before installing the agent for Content Server, ensure that the following prerequisites are met.

For example, you must install the ACC library on VCS before installing the agent for Content Server.

See [“Before you install the Cluster Server agent for Content Server”](#) on page 16.

Configuring Content Server resources

Before using Content Server resources, ensure that you configure the resources properly. For a list of attributes used to configure all Content Server resources, refer to the agent attributes.

See [“Documentum Content Server agent attributes”](#) on page 27.

Starting the Content Server instance outside a cluster

If you face problems while working with a resource, you must disable the resource within the cluster framework. A disabled resource is not under the control of the cluster framework, and so you can test the Content Server instance independent of the cluster framework. Refer to the cluster documentation for information about disabling a resource.

You can then restart the Content Server instance outside the cluster framework.

Note: Use the same parameters that the resource attributes define within the cluster framework while restarting the resource outside the cluster framework.

A sample procedure to start a Content Server instance outside the cluster framework, is described as follows.

To restart the Content Server outside the VCS framework

- 1 Log in to the Content Server node as an DMUser.

```
# su - DMUser
```

- 2 Source the environment file.

```
# . EnvFile
```

- 3 Start the Content Server.

```
# DMBase/dm_start_DocbaseName
```

If the Content Server instance works properly outside the cluster framework, attempt to implement the Content Server instance within the cluster framework.

Verifying Second Level Monitor command

If you have enabled Second Level Monitoring and are facing problems with the Content Server agent resource, verify whether the second level monitor command is working properly outside the cluster control. To ensure proper working, you must disable the resource within the cluster framework.

A disabled resource is not under the control of the cluster framework, and so you can test the Content Server instance independent of the cluster framework. Refer to the cluster documentation for information about disabling a resource. Then you can verify the second level monitor command for the Content Server instance outside the cluster framework.

A sample procedure is illustrated as follows.

To verify the second level monitor command for a Content Server instance outside the cluster framework

- 1 Log in to the Content Server node as a DMUser.

```
# su - DMUser
```

- 2 Source the environment file.

```
# . EnvFile
```

- 3 Execute the second level command

```
# JavaHome/bin/java  
com.documentum.server.impl.utils.ContentServerStatus -docbase_name  
DocbaseName -user_name DMUser
```

If the command works properly outside the cluster framework, attempt to implement the Content Server within the cluster framework.

Reviewing error log files

If you face problems while using Content Server or the agent for Content Server, use the log files described in this section to investigate the problems.

Using Content Server log files

If Content Server instance is facing problems, access the Content Server log files to diagnose the problem. The Content Server log files are located in the *DMBase/log/* directory.

Reviewing cluster log files

In case of problems while using the agent for Content Server, you can access the engine log file for more information about a particular resource. The engine log file is located at `/var/VRTSvcs/log/engine_A.log`.

You can also access the ContentServer agent log file for more detailed information. The agent log file is located at `/var/VRTSvcs/log/ContentServer_A.log`.

Using trace level logging

The `ResLogLevel` attribute controls the level of logging that is written in a cluster log file for each Content Server resource. You can set this attribute to `TRACE`, which enables very detailed and verbose logging.

If you set `ResLogLevel` to `TRACE`, a very high volume of messages are produced. Symantec recommends that you localize the `ResLogLevel` attribute for a particular resource.

The `LogDbg` attribute should be used to enable the debug logs for the ACCLib-based agents when the ACCLIB version is 6.2.0.0 or later and the VCS version is 6.2 or later.

To localize `ResLogLevel` attribute for a resource

- 1 Identify the resource for which you want to enable detailed logging.
- 2 Localize the `ResLogLevel` attribute for the identified resource:

```
# hares -local Resource_Name ResLogLevel
```

- 3 Set the `ResLogLevel` attribute to `TRACE` for the identified resource:

```
# hares -modify Resource_Name ResLogLevel TRACE -sys SysA
```

- 4 Note the time before you begin to operate the identified resource.
- 5 Test the identified resource. The function reproduces the problem that you are attempting to diagnose.
- 6 Note the time when the problem is reproduced.
- 7 Set the `ResLogLevel` attribute back to `INFO` for the identified resource:

```
# hares -modify Resource_Name ResLogLevel INFO -sys SysA
```

8 Save the configuration changes.

```
# haconf -dump
```

9 Review the contents of the log file.

Use the time noted in Step 4 and Step 6 to diagnose the problem.

You can also contact Symantec support for more help.

To enable debug logs for all resources of type ContentServer

- ◆ Enable the debug log.

```
# hatype -modify ContentServer LogDbg DBG_5
```

To override the LogDbg attribute at resource level

- ◆ Override the LogDbg attribute at the resource level and enable the debug logs for the specific resource.

```
# hares -override ContentServer LogDbg
# hares -modify ContentServer LogDbg DBG_5
```

Sample Configurations

This appendix includes the following topics:

- [About sample configurations for the agents for Content Server](#)
- [Sample agent type definition](#)
- [Sample configuration](#)
- [Sample service group configuration](#)
- [Sample service group dependency for Content Server and Connection Broker](#)

About sample configurations for the agents for Content Server

The sample configuration graphically depicts the resource types, resources, and resource dependencies within the service group. Review these dependencies carefully before configuring the agents for Content Server. For more information about these resource types, refer to the *Cluster Server Bundled Agents Reference Guide*.

Sample agent type definition

This section lists the sample agent type definition files for Content Server agent on different versions of VCS.

For VCS 4.x

```
type ContentServer (
static str ArgList[] = { ResLogLevel, State, IState, DocbaseName, DMBase,
InitFile, DMUser, EnvFile, JavaHome, MonitorProgram, SecondLevelMonitor }
    str ResLogLevel = INFO
```

```

    str DocbaseName
    str DMBase
    str InitFile
    str DMUser
    str EnvFile = "/dev/null"
    str JavaHome
    str MonitorProgram
    int SecondLevelMonitor = 0
)

```

For VCS 5.x

```

type ContentServer (
    static boolean AEPTIMEOUT = 1
    static str AgentFile = "/opt/VRTSvcs/bin/Script50Agent"
    static str AgentDirectory = "/opt/VRTSagents/ha/bin/ContentServer"
static str ArgList[] = { ResLogLevel, State, IState, DocbaseName, DMBase,
InitFile, DMUser, EnvFile, JavaHome, MonitorProgram, SecondLevelMonitor }
    str ResLogLevel = INFO
    str DocbaseName
    str DMBase
    str InitFile
    str DMUser
    str EnvFile = "/dev/null"
    str JavaHome
    str MonitorProgram
    int SecondLevelMonitor = 0
)

```

Sample configuration

This section provides a sample configuration for Content Server agent. The sample configuration depicts a graphical view of the resource types, resources, and resource dependencies within the service group.

```

include "types.cf"
include "DocumentumTypes.cf"
cluster cluster1 (
    UserNames = { admin = dlmElgLimHmKumGlj }
    ClusterAddress = "110.120.162.128"
    Administrators = { admin }
    UseFence = SCSI3
    HacliUserLevel = COMMANDROOT
)

```

```
    )
system systemA (
)
system systemB (
)
system systemC (
)

group DCM652-CS (
    SystemList = { systemA = 0, systemB = 1 }
)
ContentServer DCM652-CS_cs (
    Critical = 0
    DocbaseName = REPCVR
    DMBase = "/documentum/dba"
    InitFile = "/documentum/dba/config/REPCVR/server.ini"
    DMUser = cvradm
    EnvFile = "/documentum/env.sh"
    JavaHome = "/documentum/shared/java/1.5.0_12"
    MonitorProgram = /documentum/monitor.sh"
)
DiskGroup DCM652-CS_dg (
    DiskGroup = dcm652cvr_dg
)
IP DCM652-CS_ip (
    Device = bge0
    Address = "110.120.62.18"
    NetMask = "255.255.255.0"
)
Mount DCM652-CVRCS1_mnt (
    MountPoint = "/documentum/data"
    BlockDevice = "/dev/vx/dsk/dcm652cvr_dg/dcm652cvr_vol"
    FSType = vxfs
    FsckOpt = "-y"
)
NIC DCM652-CS_nic (
    Device = bge0
    Network Type = ether
)
DCM652CS_cs requires DCM652-CS_ip
DCM652-CS_cs requires DCM652-CS_mnt
DCM652-CS_ip requires DCM652-CS_nic
DCM652-CS_mnt requires DCM652-CS1_dg
```

```
// resource dependency tree
//
//      group DCM652-CS
//      {
//      ContentServer DCM652-CS_cs
//      {
//      IP DCM652-CS_ip
//      {
//      NIC DCM652-CS_nic
//      }
//      Mount DCM652-CS_mnt
//      {
//      DiskGroup DCM652-CS_dg
//      }
//      }
//      }
```

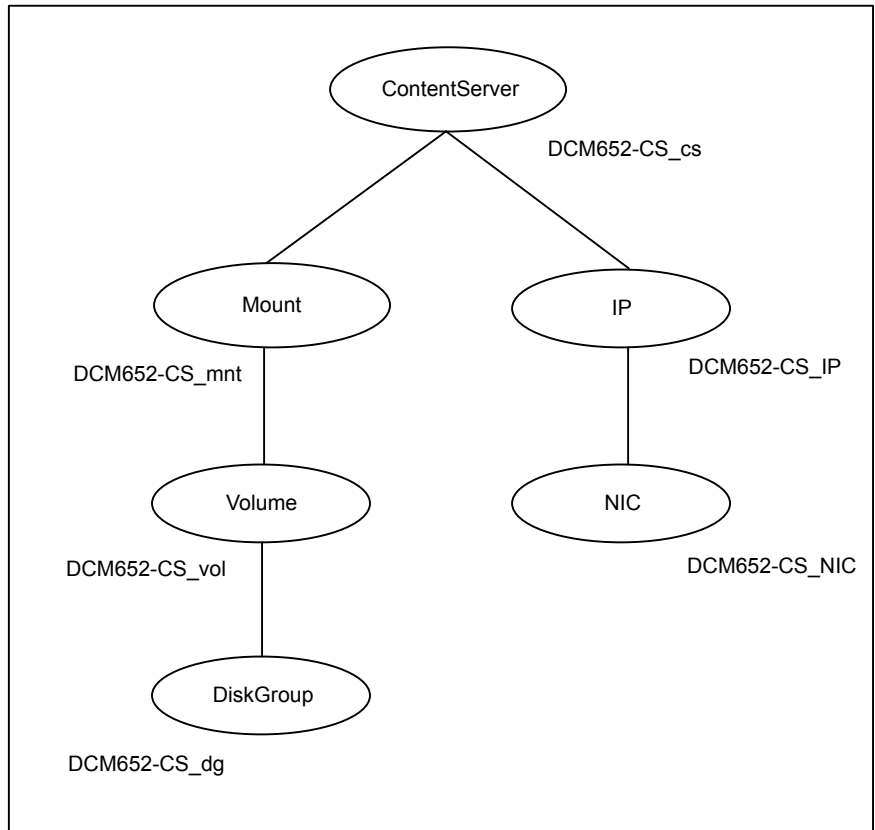

Sample service group configuration

The service group configuration in a cluster depends on some common characteristics that must be part of the configuration design.

The Content Server instance should have a separate virtual IP address assigned to facilitate network transparency.

[Figure A-1](#) shows a sample service group configuration for ContentServer instance.

Figure A-1 Service group configuration for ContentServer instance

Sample service group dependency for Content Server and Connection Broker

This section includes service groups that show the group dependency between ContentServer service group and ConnectionBroker service group.

[Figure A-2](#) shows the sample service group dependency for Documentum.
